Contents

ABBREVIATIONS	i
ACKNOWLEDGEMENTS.....	ii
CHAPTER I	1
1. BACKGROUND OF THE SURVEY	1
1.1. Introduction	1
1.2. Objectives of the Survey	3
1.3. Content and Organization of Survey Questionnaire.....	3
1.4. Training of Field Staff.....	4
1.5. Organization of the Fieldwork	5
1.6. Data Processing.....	6
1.7. Definitions of Concepts and Terms.....	6
1.8. Organization of the Report	8
CHAPTER II	9
2. SURVEY METHODOLOGY.....	9
2.1 COVERAGE.....	9
2.2 SAMPLING FRAME.....	9
2.3 SAMPLE DESIGN	9
2.4 SAMPLE SIZE AND SELECTION SCHEME.....	10
CHAPTER III	12
3. SOCIO-DEMOGRAPHIC CHARACTERISTICS OF URBAN POPULATION	12
3.1 Introduction	12
3.2 Population Size, Composition and Distribution.....	12
3.3 Number of Households and Average Household size	13
3.4 Relationship to the Head of Household.....	13
3.5 Status of School Attendance	13
3.6 Literacy Status and Educational Attainment	14
3.7 Status and Types of Training	15
3.8 Sex Composition.....	15
3.9 Marital Status.....	15
3.10 Digital Literacy and Use of Cell phone	16

CHAPTER IV	57
4. ECONOMIC ACTIVITY STATUS.....	57
4.1 Introduction	57
4.2 Data Collection Approaches	58
4.2.1. Current Activity Status Approach	59
4.2.2. Usual Activity Status Approach	59
4.3 Current Activity Status.....	60
4.4 Economically Active and Not active Population and Activity Rate	60
4.5 Economic Dependency Ratio.....	62
CHAPTER V	Error! Bookmark not defined.
5. CHARACTERISTICS OF THE EMPLOYED PERSONS	Error! Bookmark not defined.
5.1 Introduction	Error! Bookmark not defined.
5.2 Employment to Population Ratio.....	Error! Bookmark not defined.
5.3 Occupation and Industry.....	Error! Bookmark not defined.
5.4 Status in Employment	Error! Bookmark not defined.
5.5 Number of Hours worked	Error! Bookmark not defined.
5.6 Earning from Paid Employment	Error! Bookmark not defined.
5.7 Absence from Work	Error! Bookmark not defined.
5.8 Availability to Work Additional Hours	Error! Bookmark not defined.
5.9 Formal and Informal Employment Sectors of the Economic Activity	Error! Bookmark not defined.
5.10 Occupational Injuries/Accident and use of Protective Wears.....	Error! Bookmark not defined.
CHAPTER VI	245
6. UNEMPLOYMENT IN URBAN AREAS	245
6.1. Introduction.....	245
6.2. Measurement of Unemployment	246
6.3. Size and Rate of Urban Unemployment.....	248

UEUS - Urban Employment and Unemployment Survey

ACKNOWLEDGEMENTS

The Employment and Unemployment Survey has been conducted every year by Ethiopian Statistics Services /ESS/ since 2003. The 2nd round of the 2022 survey conducted from June 01, 2022- July 05, 2022 is the 13th series. The prime objective of the survey is used as an input for planning, policy formulation and to monitor and evaluate labour programs in urban areas of the country. It was initially planned to cover 1110 EAs and 28,860 households for the survey, of which 1106 enumeration areas and 28,713 households were successfully covered with the household response rate of 99.5%.

The top management and other staff members have given their unreserved administrative support in facilitating the survey operations. The dedicated professionals of ESS, Senior and junior statisticians, computer programmers and ICT personals and sampling experts at head office, and the excellent contributions of the staff members of the 23 statistical branch offices were critical to the successful completion of this survey.

The survey would have not been successfully completed without the kind cooperation of the respondents. Field enumerators and supervisors who have discharged their responsibilities in collecting the data under very difficult situations are deeply appreciated.

The ESS particularly acknowledges the following persons who contributed in various ways to the successful preparation and completion of this report:

Dr. Beker Shale (Ph. D), General Director, ESS
Ato Muluken Kere, Deputy General Director, ESS
Ato Alemayehu Teferi, Household Surveys and Prices Statistics Directorate Director, ESS
Ato Teshome Adno, Senior Statistician, ESS
Ato Abbay Getachew, Senior Statistician, ESS
Ato Sharew Ararsa, Senior Statistician, ESS
Ato Workineh Woldegiorgis, Senior Statistician, ESS
Ato Salah Yousuf, Senior Methodology and Sampling Expert, ESS.
Ato Zemecha Abedella, Senior Computer Programmer, ESS
Ato Edu Seid, Senior Statistician, ESS
Ato Abduqadir Hassen, Stastistician, ESS
Ato Biruk Teshome, Stastistician, ESS
W/o. Haregeweyn Cheru, Stastistician, ESS

CHAPTER I

1. BACKGROUND OF THE SURVEY

1.1. Introduction

Statistical information on all aspects of the population is vital for the design, implementation, monitoring and evaluation of economic and social development plan and policy issues. Labour force survey is one of the most important sources of data for assessing the role of the population of the country in the economic and social development process. It is useful to indicate the extent of available and unutilized human resources that must be absorbed by the national economy to ensure full employment and economic wellbeing of the population. Statistics on the labour force further present the economic activity status and its relationship to other social and economic characteristics of the population. Seasonal and other variations as well as changes over time in the size, distribution and characteristics of employed and unemployed population can be monitored using up-to-date information from labour force surveys. It serves as an input for assessing the achievements of the post 2015 Sustainable Development Goals (SDGs). Furthermore, labour force data is also useful as a springboard for monitoring and evaluation of the ten years' national development plan of the country.

Despite the significance of the labour force data, the availability of reliable and timely labour force data were inadequate. The lack of reliable and timely data on different aspects of the population hinders the monitoring and evaluation of changes of developmental activities.

The Ethiopian Statistics Service (ESS) has been providing labour force and related data at different levels with various contents and details in order to fill the gap in data requirement for the purpose of planning, monitoring and evaluation. These include the 1976 Addis Ababa Manpower and Housing Sample Survey, the 1978 Survey on Population and Housing Characteristics of Seventeen Major Towns, the 1980/81 and 1987/88 Rural Labour Force Surveys (RLFS). The 1984, 1994 and 2007 Population and Housing Censuses and the 1999, 2005, 2013 National Labour Force Surveys and the 2021 National Labour Force and Migration Surveys provided a comprehensive national labour force data representing both urban and rural areas.

Considering the development process of the country and dynamic nature of the sectors and fulfilling the demands of different data users, the ESS has been launched Urban Employment Unemployment Survey program (UEUS) since 2003. The ESS conducted UEUS in 13's rounds including this 2nd Round 2022's.

The statistical and analytical reports were published together in 2003, 2004 and 2006, while from 2009 to 2012 published separately. Thereafter, only the statistical reports were published. For the purpose of providing summary report for policy makers and planners, the CSA also began to publish key findings of the survey result since 2010.

For the purpose of capturing information on economic participation of children, the former minimum age limit 10 years was lower down to 5 years since 2005. Every person aged five years and above in the sampled household was asked if he/she was engaged in any economic activities during the last seven days, and the last six months prior to the survey date. This is because children in rural and urban areas used to work at their early age such as collection of fire wood, looking after cattle, shoeshine, street vendor, petty trading...etc. However, based on Ethiopian situation, the lower age limit for measuring the economic activity status was set at ten years. This statistical report is therefore mainly aimed at provide information on the economic characteristics of the population aged ten years and above.

This statistical report presents a brief introduction of each chapter including basic concepts based on ILO standard definitions together with statistical tables.

1.2. Objectives of the Survey

The general objective of the 2nd Round of 2022 Urban Employment and Unemployment Survey is to provide statistical data on the distribution, characteristics and size of the economic activity status i.e. employed, unemployed population of the country at urban levels on annual basis. The specific objectives of the survey are to:

- ✓ collect statistical data on the potential manpower and those who are available to take part in various socio-economic activities;
- ✓ update the data and determine the size and distribution of the labour force participation and the status of economic activity for different sub-groups of the population at different levels of the country; and also to study the socio-economic and demographic characteristics of these groups;
- ✓ identify the size, distribution and characteristics of employed population i.e. working in the formal or informal employment sector of the economy and earnings from paid employees by occupation and Industry...etc;
- ✓ provide data on the size, characteristics and distribution of unemployed population and rate of unemployment;
- ✓ provide data that can be used to assess the situation of women's employment or the participation of women in the labour force; generate annual time series data to trace changes over time;

1.3. Content and Organization of Survey Questionnaire

The questionnaire was organized in to six sections;

Section - 1: Area identification of the selected household: this section dealt with area identification of the respondents such as region, zone, wereda, etc.

Section - 2: Socio-demographic characteristics of households: it consisted of the general socio-demographic characteristics of the population such as age, sex, education, status and type of migration, disability, literacy status, educational Attainment, types of training and marital status.

Section – 3: Economic activities during the last seven days: this section dealt with a range of questions which helps to see the status and characteristics of employed persons in a current status approach such as hours of work in productive activities, occupation, industry, status in employment, earnings from employment, job mobility, service year for paid employees employment in the formal and informal sector and time related under employment.

Section – 4: Unemployment and characteristics of unemployed persons: this section focused on the size, rate and characteristics of the unemployed population.

Section – 5: Economic activities during the last six months: this section consists of the usual economic activity status refereeing to the long reference period i.e. engaged in productive activities during most of the last six months, reason for not being active.

A structured questionnaire was used to solicit the required data in the survey. The draft questionnaire was tested by undertaking a pretest in selected kebeles (lower administrative unit) in Addis Ababa. Based on the pretest, the content, logical flow, layout and presentation of the questionnaire was amended. The questionnaire used in the field for data collection was prepared in Amharic language. Most questions have pre coded answers and column numbers were assigned for each question. A copy of the questionnaire translated in English language is attached as Annex I of this report for reference.

1.4. Training of Field Staff

The training program of the survey was conducted at three selected training centers: Adama, Hawassa, and Dire Dawa towns. The training was given from 18- 31 May,/2022. The trainees were from branch offices supervisors and enumerators. The training was given by senior head office professionals, and branch statisticians guided by an enumerator and supervisor manuals, together with occupation and industry code books. In addition, the training was supplemented with classroom discussions on concepts and definitions, techniques of filling out the digital questionnaire as well as mock-interview and one-day field practice followed by general discussion. The objectives of mock interview and field practice were twofold. First, to enable trainees how well understood the theoretical class room presentations. The second objective was to examine the difficulties which were likely to be encountered during the actual fieldwork. The discussions were intended to exchange experiences among participants and pinpoint the areas of the survey questions in need of further care and attention.

The 23 Statistics Branch offices of the ESS were participated in the survey process such as recruiting and deploying the field staff to their respective sites. They were also responsible in

administering the financial and logistic aspect of the survey as well as field supervision within the areas of their assignment.

Following the accomplishment of the main training program, the 13th series of the 2nd Round of the 2022 Urban Employment and Unemployment Survey conducted from June 01, 2022- July 05, 2022.

1.5. Organization of the Fieldwork

In order to carry out this survey with the desired level of quality, there was a need to organize a large staff that performs the various survey activities. The 23 Branch Statistical Offices of the ESS were responsible to carry out the data collection operation. These offices have permanent and contract enumerators stationed in the selected enumeration areas. The total manpower in data collection operation including the training program of the survey, involved a total of about 657 properly trained enumerators, 153 field supervisors, 23 statisticians at branch office, 40 professionals and 23 IT Experts from the head office with an average supervisor to enumerator ratio of 1: 3 that took place from June 01, 2022- July 05, 2022. The interviews have been done by canvassing from house-to-house. Information was collected directly from the head of the household or from other responsible household member.

One enumerator was assigned to 3 sampled enumeration area in major urban areas and two sampled enumeration area in other urban areas, where he/she could easily converse with the respondent's dialect. However, in some cases whenever enumerator faces difficulty to converse with the respondent's a dialect interpreter were used to facilitate the data collection.

Data collection from the field took place from June 01, 2022- July 05, 2022. During the survey data collection operation, close and regular supervision was undertaken at various levels. Immediately after the commencement of the data collection exercise the supervisors had made spot checking, re-interviewing and a thorough scrutiny of filled-in questionnaires to ensure that the data collection activities are taking place according to the given instruction. The branch statistical office heads, coordinators and statisticians were also made supervision of the data collection operation.

All branch statistical offices of the ESS participated in the survey process undertaken, that is, in organizing the field survey in deploying the field staff to their respective sites, and retrieving completed questionnaires and submitting them to the head office. They will also responsible in administering the financial and logistic aspect of the survey as well as field supervision within the areas of their assignment.

1.6. Data Processing

During the fieldwork, field supervisors and statisticians of the head and branch statistical offices have checked the filled-in questionnaires and carried out some verification, editing and consistency check using digital data collection system. As the enumerator completed each of the questionnaire must sent to their respective supervisors for further checking and editing. Thereafter, the supervisors sent to the central sever of the head office.

Consistency checks and re-checks were also made based on frequency and tabulation results at the head office. This was done by senior programmers using CPro software in collaboration with the senior subject matter experts from the labour statistics team of the ESS. This is an important part of data processing operation to maintain the quality of the data.

1.7. Definitions of Concepts and Terms

Some of the major operational definitions of basic concepts are given below. Moreover, other concepts and definitions related to the economic activity status are provided under respective chapters.

Urban Center: is defined as a locality with 2000 or more inhabitants. In this survey, however, for practical purposes an urban center includes the following regardless of the number of inhabitants.

- a) All administrative capitals
 - i) Regional capitals
 - ii) Zonal capitals not included in (i)
 - iii) Wereda capitals not included in (i) and (ii)
 - iv) Localities with Urban Dweller's Association (UDAs) not included in (I-iii).

- b) Municipal town not included in item (a) above.
- c) All localities which are not included either in item (a) or (b) above, having a population of 1000 or more persons, and whose inhabitants are primarily engaged in non-agricultural activities. Note that localities with population less than 1000 persons should be considered as rural.

Major Urban Centers: For the purpose of this study, major urban center include those selected urban centers with population 100,000 and above. It also includes region capitals irrespective of their population size.

Urban Kebele: is the lowest administrative unit in an urban center with its own jurisdiction. It is an association of urban dwellers (commonly known as kebele) formed by the inhabitants.

Enumeration Area (EA): is a unit of land delineated for the purpose of enumerating population and housing units without omission and duplication. An EA in rural areas usually consists of 150-200 households. On the other hand, an EA in urban areas constitutes 150-200 housing units.

Household: Consists of a person or group of persons, irrespective of whether related or not, who normally live together in the same household and housing units and have common cooking and eating arrangements.

Housing Unit :is defined as a separate and independent place of abode either intended for habitation or not intended for habitation but was occupied as a living quarter by a household during the survey period. Although intended for habitation by one household, a housing unit may, at the survey be occupied by one or more households or may be used partly for living and partly for establishment.

Head of Household: is a person who provides economic supports or manages the households. The head of the household is selected by household members for some reasons of his age or respect regardless of their sex.

Usual Member of a Household: a person is considered as usual members of a household if he or she is:-

- ✓ a person who continuously live/reside at least for six months and have a common cooking and eating arrangements with the household; or
- ✓ a person who is temporarily absent from the household at the time of the survey but his absence has not violated the six months criterion.
- ✓ House maids, guards, baby sitters, etc...with no other dwelling and who were staying with the household at the time of the survey.

Persons who plan to live more than six months due to searching for job and transfer from job ...etc.

1.8. Organization of the Report

This statistical report contains six chapters. The first chapter covers background and objectives of the survey, where the objectives and the contents of the survey questionnaire, training of field staff, organization of field work, definitions of terms and concepts. Chapter II presents methodology of the survey including scope, coverage, sample size, covered households and response rate. Chapter III describes briefly the socio-demographic characteristics of the urban population such as the size and distribution of urban population by age group and sex. Chapter IV presents data on the economic activity status of the population aged ten years and above using the current status approach. Chapter V and VI explores the size, characteristics and distribution of the employed and unemployed population aged ten years and above, respectively.

Annex I provides survey questionnaire in English version, while estimation procedures of total, ratio and sampling errors; and estimates and CV's are also presented in Annex II and Annex III, respectively.

CHAPTER II

2. SURVEY METHODOLOGY

2.1 COVERAGE

The 2nd Round of the 2022 Urban Employment and Unemployment Survey (UEUS) fully covered the entire urban areas of the country except the Tigray region. All residential households in urban areas of the country were the target for the survey, however, the survey does not include the people residing in the collective quarters such as universities/colleges, hotel/hostel, monasteries and the homeless living on the streets, therefore, it has to be noted that the urban population estimate provided in this survey refers only to residential households.

It was initially planned to cover 1110 EAs and 28,860 households for the survey, of which 1106 enumeration areas and 28,713 households were successfully covered with the household response rate of 99.5%.

2.2 SAMPLING FRAME

The list of households obtained from the new cartographic frame prepared for the upcoming population and housing census was used to select EAs. Whereas, afresh list of households prepared at the beginning of the survey was used as a frame in order to select 26 households from each sample EA.

2.3 SAMPLE DESIGN

For the purpose of representative sample selection, the urban part of the country was divided into two broad categories. That is major urban centers and other urban centers categories.

Category I: - Major urban centers: - In this category all regional capitals and sixteen other major urban centers that have had a high population size as compared to others were included. Each urban center in this category was considered as a domain of estimate. This category has a total of 27 domains where major findings of the survey is reported. In this category, in order to select the sample, a stratified two-stage cluster sample design was used. The primary sampling units were EAs of each domain. From each sample EA 26 households were then systematically selected as a Second Stage Unit (SSU).

Category II: - Other urban centers: Urban centers in the country other than those under category I were grouped into this category. The other urban domain was formed for the other urban areas of

eight regions except Addis Ababa, Harari and Dire Dawa regions because these regions do not have medium as well as small size towns.

Similar to category I stratified two stage cluster sample design was used to select samples from this category. The primary sampling units were EAs and. the secondary sampling units were households finally the survey questionnaires were administered for all selected households.

2.4 SAMPLE SIZE AND SELECTION SCHEME

Category I: - In this category 752 EAs and 19,552 households were selected from 27 major urban centers. Sample EAs from each domain were selected using probability proportional to size /PPS/ sampling method; size being number of households obtained from the new cartographic frame prepared for the upcoming population and housing census. From the fresh list of households prepared at the beginning of the survey, 26 households per EA were selected using systematic random sampling techniques /SRS/.

Category II: -Under this category 358 EAs and 9,308 households were selected from other urban domains of eight regions except Harari region, Addis Ababa and Dire Dawa city administrations. Sample EAs from each domain were selected using probability proportional to size /PPS/ sampling method; size being number of households obtained from the new cartographic frame. From the fresh list of households prepared at the beginning of the survey, 26 households per EA were selected using systematic random sampling techniques /SRS/.

1 Table 2.1: Number of Planned and Actually Covered Sampling Units (EAs and households) of the 2022 (2014 E.C) Second Round Urban Employment and Unemployment Survey (UEUS).

CHAPTER III

3. SOCIO-DEMOGRAPHIC CHARACTERISTICS OF URBAN POPULATION

3.1 Introduction

The Demographic information is important as it is the basis for analyzing population characteristics and their relationship with other determinants of population change. Data on the demographic characteristics provide background information and the necessary framework that allows determination of the thresholds for defining the working-age population as well as the labour force.

The figures in this chapter refer to the de jure population residing in conventional households. The de jure population comprises all persons who belong to a given area at a given time by virtue of usual residence. Thus, visitors, persons residing in collective quarters (hotel/hostel, boarding schools, prisons...etc.) as well as homeless persons are not included.

This chapter provides an overview of the basic socio-demographic characteristics of urban population of the country which includes population size; distribution of the population by age and sex, sex ratio, relationship to the head of household, number of households and household size, literacy status, attending formal or informal education, educational attainment, training status and type of training, use of ICT and marital status.

3.2 Population Size, Composition and Distribution

The Urban Employment Unemployment Survey 2022 2nd round estimated the total urban population of Ethiopia (not including the Tigray Region, which was not covered in the survey) at about 22,436,333 million people. As shown in Table 3.1, of the total population, 11,657,580 (52%) were females and 10,778,753 (48%) were males.

At country level, the urban population aged below 15 years was accounted for 34.5 percent while the older persons (65+ years) comprised 3 percent of the total population. About 37.5% of the population is in the dependent category which comprises of people below 15 years and above 65 years. The percentage of people who were working age (15–64) was estimated to be 62.5

percent of the total population. The population of the youth, according to the Ethiopian definition (15-29 years), was a proportion of 32 percent.

3.3 Number of Households and Average Household size

Household size is important in understanding the structure of population. The employed persons normally work to support themselves and their families. Therefore, the size of the population and household size is important in assessing the burden carried by employed persons and the position of households to furnish labour in the workforce. The average household size is the ratio of the total population to the total number of households. For this survey, the estimated number of households in urban Ethiopia was reported 6,121,107. The highest percentage of household members (19.4%) reported was for three members, closely followed by four members (19.2%). The results in Table 3.2 indicate that in June 2nd round UEUS 2022, the average household size for the de jure population (usual household residents) was 3.7 persons per household. The highest average household size was observed in Somali (4.5%) whereas the lowest was recorded in Harari (3.2%).

3.4 Relationship to the Head of Household

Information on the relationship to the head of the household was collected for all usual members of the household. Relationship to the head of household is essential in the study of household composition and family formation. Table 3.3 shows the distribution of the population by relationship to the head of household. This reveals that biological children to the head of household accounted for 44.5 percent of the total population, irrespective of their sex. The head of household constituted the second highest proportion at 27.3 percent, while the lowest proportion of relationship to the head of the household was non-relatives at 0.7 percent.

3.5 Status of School Attendance

Some questions were asked about school attendance: whether the person currently attending; attended in the past and had never attended school. Table 3.4 and Table 3.5 show the status of school attendance for those aged 5 years and above by age group and sex at national and regional levels. Overall, 17.6 percent of persons 5 years and above had never attended school while 47.9 percent were attended school in the past and 34.5 percent were still attending school during 2nd

round UEUS 2022. The proportion of those who have never attended school was greater among females than males (65.5 percent versus 34.5 percent).

3.6 Literacy Status and Educational Attainment

The literacy status and educational attainment of urban population aged ten years and above has shown in Table 3.6 and Table 3.7, respectively. A single question was asked about literacy: whether the person could read and write in any language. A person is said to be literate if he/she is able to read and write at least in one language. Those persons who can read and write were further asked to report the highest grade they have completed in the formal education system. As indicated in these tables secondary education refers to those persons who did not complete high school education, that is, grades 9 - 11 in old curriculum and grade 9 in new curriculum, while secondary education completed covers those persons who completed high school education which includes grade 12 in old curriculum and grade 10 in new curriculum. Education attainment refers to the highest level of education an individual has completed. Higher educational attainment, in terms of recognized qualifications, is associated with a range of positive outcomes, including better income, employment, and health among others. As the requirements for many jobs and the related expectations of employers are rising, education that provides the necessary skills and knowledge has become essential for fuller participation in society and a productive workforce. According to the survey result, among the total urban population age 10 years and above, 17.7 percent were found to be illiterate, and 82.3 percent is literate. The percentage of those who cannot read and write is noticeably higher for females at 69.6 percent compared to only 30.4 percent for males. (Table 3.6)

Results in Table 3.7 depict that the majority of persons (41.3 percent) had primary education level (Grade 1-8) posing a challenge to the quality of manpower in the country in this era. Persons with secondary education accounted for 10.2 percent of the total population aged 10 years or above. Diploma and above education, which is the most desirable level for an efficient workforce accounted for only 10.1 percent of all persons aged 10 years or above.

3.7 Status and Types of Training

Vocational training provides an important opportunity for many people to develop skills useful in the work place. The survey asked everyone aged 10 years and above if they had ever attended any form of vocational training and if so what type of training they received and in what year they graduated/certified. If someone had participated in more than one training course, only the training that took long training period was recorded.

In this survey a person is considered as trained if he/she has passed through any short or long-term skill/ability development-training program, given in or outside classroom, in theory or in practice or both, and that resulted in award of a certificate to the training. It should be noted that the trainee could be either literate or illiterate. From the total persons age ten years and above 3,763,764 persons (22.2 %) have received some kind of training of which 2,260,064 (60%) males and 1,503,700 (40%) females. (Table 3.8)

3.8 Sex Composition

It is also important to determine the sex composition of the total population in urban Ethiopia, which is measured by the sex ratio defined as the number of males per 100 females in a given population. A sex ratio of 100 indicates equal numbers of males and females, a sex ratio above 100 indicates an excess of males, and a sex ratio below 100 indicates an excess of females. The sex composition has an effect on economic activities through changing the relative size of the working population. The overall sex ratio of the urban Ethiopia is 92.5, indicating excess of females over males (Table 3.9)

3.9 Marital Status

This refers to the categorization of the population in relation to whether an individual is married, never married, separated, divorced, widowed or cohabiting. Marital status is the most common measure of family relationship collected in household surveys. This survey collected data on marital status of the population age 10 years and above. Results in Table 3.10 show that the majority of persons in urban Ethiopia were married (48.1 percent) followed by those who were never married (42.5 percent). The lowest proportion was of persons cohabiting (0.5 percent).

3.10 Digital Literacy and Use of Cell phone

Ability to use computers and internet facilities and access to cell phone are fundamental for the success of diverse official and communications initiatives both in developed and developing countries like Ethiopia. Data on the use of ICT devices and accessibility of cell phone were collected from person age 10 years and above. Nationally, in urban settings only 30.3 percent of population reported to have ability to use computer and the proportion of persons who had ability to use internet were 45.7 percent.

The population which uses cell phone was about 84.5 percent during the survey period (Table3.11).

2 Table 3.1: Estimated Total Population of Urban Areas by Age Group, Sex and Region: 2nd Round UEUS, 2022

CHAPTER IV

4. ECONOMIC ACTIVITY STATUS

4.1 Introduction

Statistical data on the economic activity status of a population is essential for planning and formulating policies for better utilization of human resources of a country. The economic activity status indicates the size and distribution of the work force of economically active and not active population during a given reference period at a specified area.

In this regard, a wide range of information was collected on economic activity status of all persons aged five years and above in the 2022 UEUS 2nd Round. For the purpose of gathering information about the economic activities of children, the lower age limit was fixed at five years and hence data were collected from persons aged five years and above. However, for the purpose of measuring the economic activity status of adult population according to the Ethiopian situation, the lower age limit was fixed into ten years.

The 2nd round of 2022 Urban Employment and Unemployment Survey administered detailed labour force questions to measure the economic activity status of persons in urban areas of the country. These includes:-

- ✓ whether persons were engaged in economic / productive activities in the last seven days prior to the survey date or reasons for not being engaged;
- ✓ whether persons were looking for work or will be available for work in the coming one month or reason for not being available during the reference period; and
- ✓ whether persons were engaged in economic / productive activities during most of the last six months or reasons for not being engaged.

All person aged five years and above in the sampled household was asked if he/she was engaged in any productive activities during the last seven days, and in the last six months prior to the survey date. Based on the response obtained from respondents, the economic activity status of the population was determined by using the standard definitions of economic and non-economic activities.

This 2nd round of 2022 Urban Employment and Unemployment Survey has followed the ILO international standard definitions of economic and non-economic activities¹. In this survey, economic /productive activity is defined as work, which involves the production of goods and /or services for sale or exchange. In addition, production of goods and services for own consumption or own uses are also considered as economic activities. These include production of primary products (agriculture, hunting, fishing, forestry and logging, mining and quarrying), for own consumption; processing of primary products by the producers themselves; production of other commodities where part of it is sold on the market; and own account construction and fixed asset formation (expected life use of one year or more). Such economic activities could be performed for an individual, family or private enterprise, government establishment or social organization. The remuneration may be on daily, weekly, monthly, yearly or contract basis. The practical activities of apprentices are also considered as economic activities. On the other hand, unpaid household chores such as preparing food, cleaning the house, taking care of children are not considered as economic activities. Similarly, unpaid community and volunteer services are classified as non-economic activities.

Based on the above ILO definitions, data on economic activity status of persons aged ten years and above was presented in this report. Persons who were engaged in productive work /employed/ or available to be engaged /unemployed/ during the reference period are considered as economically active persons. Persons who were neither engaged nor available to be engaged in the production of economic goods and services during the reference period are considered as the economically not active population.

4.2 Data Collection Approaches

The survey used two approaches in the collection of data about the economic activity status of the population. These are current and usual activity status approaches. The main difference between these two approaches is the length of the reference period.

¹ The concept of economic activity, as adopted from the 13th International Conference on Labour Statistics (ICLS) 1982, is defined as the production of goods and/or services that falls within the United Nations System of National Accounts (SNA) production boundary (ILO, 1990).

4.2.1. Current Activity Status Approach

This approach measures the economic activity status of a person based on a short reference period of seven days before the date of the interview. It also considered all persons aged ten years and above who were engaged in productive work or available to be engaged during the reference week as currently active, while those who were neither engaged nor available to be engaged in productive work were noted as not currently active.

4.2.2. Usual Activity Status Approach

The usual activity status approach measures the economic activity status of a person based on a long reference period of the six months prior to the date of interview. In the usual activity status approach, all persons aged ten years and above who were engaged in productive works or available to be engaged in the production of economic goods and/or services during most of the six months were classified as usually active. Persons who were neither employed nor unemployed during most of the six months categorized as usually not active.

The choice of appropriate measurement approach depends on the extent of variability of economic activities of the population during a specified period in a given the study area. In the rural areas where seasonal variation of activities is common, to collect the economic activity status of the rural population including the slack and peak periods of agricultural activities, a longer reference period (usual activity status approach) is found to be more appropriate. On the other hand, in urban areas, activities are relatively less affected by seasonal variations and hence shorter reference period or current activity status approach is found to be more convenient. In this survey, however, both approaches were used to collect data on economic activity status of the population.

This chapter presents the economic activity status aged ten years and above, size and distribution of economically active and not economically active urban population, activity rate, and reasons for not being economically active of urban population by using only the current status approach at national, regional and major town levels.

4.3 Current Activity Status

As mentioned above, current activity status approach measures the economic activity status of a person in a short reference period, that is, the seven days prior to the date of the interview. In this approach a series of inquiries were administered to determine the economic activity status of the population during the reference week such as engagement in economic activity, attachment to the job, seeking and availability to work, reason for not seeking or available to work, etc. These questions were presented to those persons aged five years and above. For the purpose of reporting, persons aged ten years and above were used to classify the population into three mutually exclusive categories: employed, unemployed, and not in the labour force (Not Economically active). The employed and the unemployed population together constitute the labour force or the currently active population. The third category, those who were not in the labour force are called the not currently active population.

As part of the economically active population, employed population consists of persons aged ten years and above who engaged in a productive activity or work at least for one hour during the seven days prior to the date of the interview. In addition, persons who had regular jobs, or business, or holdings to return to but who were temporarily absent from work (not at work or worked less than one hour) for various reasons such as illness or injury, holiday or vacation, strike or lockout, and seasonality of work, annual leave, temporary closure of establishment were also considered as employed. For a person to be considered as absent from work, he/she must have formal attachment to the job.

The currently unemployed population also comprises those persons without work but looking for work or available and ready to work if any job is found during the reference period of the coming one month. The reference period of the coming one month refers to the survey week plus the next three weeks. A person who is looking for work but is also engaged in productive activity during the reference week is recorded as employed and not as unemployed.

4.4 Economically Active and Not active Population and Activity Rate

Based on the above definition of economic activity status, the number of economically active population including employed and unemployed persons, population not active and activity rates of urban population aged ten years and above at national and regional level is presented by sex

and age group in Table 4.1 and Table 4.1.1- 4.1.11 using the current status approach, respectively. Besides, the economic activity status and activity rate of selected major towns' population aged ten years and above is also presented in Table 4.2.

The extent of the economic participation of the population is measured using economic activity rates. Economic activity rate or economic participation rate is computed as the percentage of the economically active population over the total of active plus not active population aged ten years and above. The national estimate shows that 59.8 percent of the population aged ten years and above were economically active (Table 4.1). With respect to sex, the activity rate of male is 68.5 percent and the corresponding female activity rate is 52.1 percent. The age distributions of activity rate illustrate that it is low at younger and older age groups. The table also shows a relatively stable for Middle Ages between 20-59 years, and reaches its peak in the age groups of 30-44 and 35-39 (Table 4.1).

As far as the economic activity status of major towns' population is concerned, 61.9 percent of the populations were economically active while the remaining 38.1 percent were found to be the population not economically active. In terms of sex, the activity rate of male (70.3 per cent) was higher by 15.3 per cent than female (55.0 per cent). Among the major towns, the highest activity rates were recorded in Assosa town (72.5 per cent) and followed by Debre Birhan town (72.3 per cent) while the lowest was for Jijiga town (38.4 per cent) (Table 4.2).

The size of economically active and not active population has its own implication on the development of the local as well as the national economy of a region. The high activity rate of a population implies the prevalence of huge potential of the human resource or human labour that foster sustainable economic development. On the other hand, the low economic activity rate also implies the lack of adequate and trained human labour or the existence of large number of economically non-productive population which has no contribution for development at the time. Hence, the economic activity rate of the urban population of the Ethiopia can be viewed from these perspectives.

The distribution of economically not active population of urban areas at national and regional level by age group, sex and reason for not being economically active (for those who were

neither engaged nor available and/ or seeking work) during the last seven days are presented in Table 4.3 and Table 4.4, respectively. The reasons for not looking for or available to work include; home maker, pregnancy, student, disability, illness, too young, old age, pensioned, remittance and other reasons. The result in Table 4.3 shows that the lion share of the population not active were students for the national (64.9 per cent). The remaining per cent was the other groups of reasons for the economically not active population. The same reason holds true for the regions, too (Table 4.4).

4.5 Economic Dependency Ratio

According to Shryock and Siegel (1976), the economic dependency ratio may be defined as the ratio of the economically inactive population to the active population over all ages, or of non-workers to workers. It is also possible to describe the indicator, economic dependency ratio which gives the numbers of persons unemployed or outside the labour force per one employed persons. This ratio provides a useful approximation to economic dependency burden than that of age dependency ratio. This means that when the number of employed rises relative to the number of unemployed and persons in the inactive population, the economic dependency ratio falls. Correspondingly, when the number of unemployed and persons in the inactive population grows relative to the number of employed, the economic dependency ratio grows.

A “worker” is anyone who is considered employed according to the ILO definition of employment, i.e. anyone aged 15 and above who works for at least one hour per week (International Conference of Labour Statisticians (year)). Economic dependency has been defined in various ways in the literature, depending on what is considered the appropriate definition of activity and inactivity (Elke Loichinger and Vegard Skirbekk, 2016). What we refer to an employed person here is that, a person ages 10 and above who works in productive activity for at least one hour per week in Ethiopian case. Therefore, the economic dependency ratio (EDR), which relates the number of non-workers to the number of workers in a given economy, provides a better representation of the share of the dependent population.

$$\text{Economic Dependency Ratio (EDR)} = \frac{\text{U} + \text{I} + \text{Age 0-9 years}}{\text{E}} * 100$$

Where:

U = Unemployed Persons (age >=10 years)

I = Person Not in the Labor Force (age >=10 years)

E = Employed Persons (age >=10 years)

Age 0-9 years = Children Age 0-9 years

Table 4.5 presents economic dependency ratio (EDR) of urban population of Ethiopia by activity status and sex of the year 2022. The 2nd round of the 2022 UEUS result shows that EDR is 169 dependents at country level. This means for each 100 employed persons, there are almost 163 dependents to be supported in terms of food, clothing, health, education and so on. This means that there were 163 non-employed persons per one hundred employed persons. At Regional level, the highest EDR registered in Somali (329), Gambella Region (201) and Sidama Region (200) in that order and the lowest is recorded for Harari Region (139). Similarly, at country as well as regional levels, EDR is more intense on females than males.

CHAPTER V

5. CHARACTERISTICS OF THE EMPLOYED PERSONS

5.1 Introduction

The previous chapter has defined the economically active population to be the sum of the employed and the unemployed population. This chapter presents statistical data on the size, distribution and characteristics of the employed persons based on the definition given in chapter IV. The survey has collected the following information regarding the characteristics of the currently employed persons:

- 1) Main type of occupation;
- 2) Main product or service of the establishment or industry;
- 3) Employment status of the main activity and terms of employment;
- 4) Reasons for absence from work for those employed persons who worked less than one hour or does not work at all but have formal job attachment during the reference period;
- 5) Amount of earnings from paid employment;
- 6) Hours worked per week;
- 7) Whether employed persons were available or seeking to work additional hours.
- 8) Sector of the economy (Formal or informal employment sector);
- 9) Occupational Injuries/Accident and use of Protective Wears

5.2 Employment to Population Ratio

According to the 18 Key Indicators of Labour Market (KILM) used by the ILO, employment to population ratio is calculated as a percentage of total employed persons to that of the working age population (ILO, 1999). The distribution of employment to population ratio of urban areas of each region by age group and sex is shown in Table 5.1. The data for employment to population ratio of each selected major towns by age group and sex is also presented in Table 5.2.

The employment to population ratio in the 2022 UEUS was **48.5%**. The size of employed persons was estimated 8,226,580. From the total employed persons estimated in the 2nd round of UEUS 4,895,606 (**61.5%**) were males and 3,330,974 (**37.0** percent) were females, respectively. The employment to population ratio in urban areas at country level was 48.5 percent with male 61.5 and female 37.0 percent.

5.3 Occupation and Industry

In this survey, employed persons were asked about the type of main activity or occupation and major product or service of the establishment or industry in which they were engaged during the survey reference period. The questions used to identify the type of occupation and industry, were left open ended so that they will be filled in with the fullest description and its code in the field. For those employed persons engaged in multiple activities, the activity that took the largest share of the respondents' time was taken as the main type of activity.

The responses of the descriptions and codes for the type of occupation and industry filled in by enumerators were further checked and edited at the headquarters using the National Occupational and Industrial Classifications (NOIC) code-book. The NOIC codes were adopted from the International Standard Classification of Occupation (ISCO-08) and International Standard Industrial Classification (ISIC, Revision 4) by taking into account the prevailing national socio-economic conditions.

The NOIC uses 4-digit coding systems corresponding to 4 level classifications in successively finer detail. In the cases of occupation and industry, the levels are ordered as major divisions, sub major divisions, minor divisions and unit divisions. The occupational classification was categorized into 10 major groups, 42 sub major groups, 132 minor groups and 467-unit groups. The industrial classification contains 21, 88, 238 and 425 sections, divisions, minor divisions and unit divisions respectively.

The distribution of employed Persons of urban areas by major occupational groups, age group and sex for the country total and each region is presented in Table 5.3 and 5.4, respectively. Table 5.5 presents the distribution of employed population by major occupation, sex for each selected major towns. The distribution of employed population by minor occupational groups for each region classified by sex appears in Table 5.6. One should note that in Table 5.6 and 5.10 major and sub major occupation and industrial classification are written in capital letter, while

minor occupation and industrial classification are written in small letter, respectively. Analogous information, which deals with the industrial divisions are also shown in Table 5.7 to 5.10.

The occupation of employed persons of the country total in urban areas 2474661 (30.1 percent) is Service and sales workers, while elementary occupation rank second 1769252 (21.5 percent). Others and managers hold the lowest position.

Concerning main Industrial Divisions, at country urban level, 1,573,023 (19.1 percent) of the employed persons are working in the Wholesale and retail trade; repair of motor vehicles and motorcycles sector followed by Agriculture 1,207,667 (14.7 percent). The service sector continues to play largest role in captivating the urban employed persons.

5.4 Status in Employment

Status in employment of a person indicates the level of involvement and degree of decision-making in his main activity. In this survey employed persons were asked about the employment status of their main activity which was classified into: employer, paid employees, self-employed, unpaid family worker, apprentice, Voluntary work and members of producer's cooperative and others categories. Paid employees were further disaggregated into employees-government, employees government parastatal, employees NGO's, employee's private organization, employees domestic and other paid employees.

Table 5.11 and Table 5.12 present the distribution of status in employment by age group and sex for urban areas of country and each region. The distribution of status in employment for major towns classified by sex is presented in Tables 5.13. Table 5.14 contains data on major occupational groups cross classified by major industrial divisions and sex for urban areas of the country total. The status in employment by major industrial divisions and sex for a country total is shown in Table 5.15. Also, the figures for status in employment classified by major occupation and sex for country total are presented in Table 5.16.

On the topic of status in employment during the 2022 survey period, (32.9 percent) employed persons were self-employed non-agriculture followed by Employee government organization

23.4 % and Employee private organization (16.5 percent) respectively. The lowest share reported for Voluntary work, employer and Member of cooperatives together accounted only 0.5%.

5.5 Number of Hours worked

The absence of standard working hours and irregular nature of working days in the informal sectors or in the self-employment, data collection as well as getting accurate data on hours of work were found to be difficult. In addition, the reliability of the data collection is likely to be affected due to memory lapse and lack of knowledge or information about the concepts of time on the part of the respondent. Thus, considering the inherent data collection problem on hours of work in developing countries, the figures presented in these tables should be regarded as indicative and not the true levels of intensity of work.

The 2022 Urban Employment and Unemployment Survey included questions on the number of hours worked for two purposes. First, the response on the number of hours worked during the seven days prior to the date of the interview is used to classify the respondents as employed or not on the basis of the given criteria of the minimum required hours of work. As described in Chapter IV, persons who worked at least one hour or more, and those who were not worked or worked less than 1 hour but had a job to return to were considered as employed. The remaining persons were then asked a filtering questions of unemployment and not active. The second objective of including questions on number of hours worked was to gather data on intensity of work among the employed population.

In this survey, all persons who were engaged in productive activities during the seven days prior to the date of interview were asked to provide the number of hours they worked in all of their productive activities. The response was recorded for each of the days in a separate notebook so as to get the total actual hours of work spent on main job and other jobs during the reference week. Then the total hours spent in the main job in the reference week were filled in the main questionnaire. In addition to hours actually worked the respondents were asked about ‘‘ How many hours they usually work in their main job per week.’’ Usual hours of work per week

identify the most common weekly working schedule over a selected period of a person in employment.

The resolution concerning statistics on hours actually worked that adopted by the 10th ICLS in 1962 (ILO, 1976), in this survey, the hours actually worked included:

- Hours actually worked during normal periods of work and time spent for waiting for the market;
- Time worked in addition to hours worked during normal periods of work, and generally paid at higher rates than normal rates (overtime);
- Time spent at place of work on activities such as the preparation of the work place; repairing maintenance, preparing and cleaning of tools and others;
- Time spent at the place of work waiting or standing by for such reasons as lack of supply of work, breakdown of machinery, or accidents, or time spent at the place of work during which no work is done but for which payment is made under a guaranteed employment contract and
- Time corresponding to short rest periods at the work place including tea and coffee breaks;

According to the resolution in recording the number of hours worked, care was taken to exclude hours paid for but not worked, such as paid annual leave, paid public holidays or paid sick leave. Also excluded are meal breaks, time spent on travel from home to work and vice versa /for those who have specified place of work/, and hours spent on household activities that were not considered as productive. For employed persons who were not at work during the seven days prior to the date of interview, the number of hours of work is recorded as zero. On the other hand, any time that employed persons have spent in productive activity in places other than work site is considered as working hour.

Table 5.17 presents the distribution of the number of hours worked during the last seven days by age group and sex at country urban level. Similarly, the distribution for each region classified by sex appears in Table 5.18. The distribution of number of hours worked by major industrial divisions, major occupation, and status in employment for country total disaggregated by sex are shown in Table 5.19, 5.20 and 5.21, in that order.

The mean number of hours worked per week was 42.5 hours in February UEUES 2022. Mean hours of work for male is 44.0 and 40.3 for female. (See Table 5:17).

5.6 Earning from Paid Employment

Paid employment jobs are those jobs where the employees hold explicit (written or oral) or implicit employment contracts, which give them a basic remuneration. Some or all of the tools, capitals equipment, information systems and/or premises used by the employees may be owned by others, and the employees may work under direct supervision or according to the strict guidelines set by the owner(s) or persons in the owners' employment. Persons in "paid employment" jobs are typically remunerated by wages and salaries, but may be paid by commission from sales, by piece rates, bonuses or in-kind payments such as food, housing or clothing. In this survey, earnings for paid employees refer to gross remuneration and include bonus, overtime, allowances and other benefits that are obtained only from the main job.

Table 5.22 shows the distribution of paid employees disaggregated by types of payment and sex for urban areas of each region. The distribution of paid employees in urban areas by sex and period of payment and sex at country level is presented in Table 5.23. The distribution of paid employees in urban areas of the country classified by amount and period of payment and sex is presented in table 5.24. Paid employees of urban areas of the country by major industrial divisions, sex and amount of payment per month has also shown in Table 5.25.

5.7 Absence from Work

Employed persons that were considered to be absent from work were those who were not engaged in any productive activity or who work less than one hour during the seven days prior to the date of the interview but have formal job attachment. These persons were asked their main reason for being absent from work. Reasons for absence from work was classified as illness, holiday /vacation, Training/education, off-season, reduction in economic activity and "others"

categories. The data presented in Table 5.26 indicates the distribution of employed population for their reasons for being absent from work by region and sex.

5.8 Availability to Work Additional Hours

This survey collected data on time related under employment in an attempt to capture the insufficiency of the hours of work of employed persons in relation to an alternative employment situation in which persons are willing and available to be engaged in. The response of employed persons depending on their availability and readiness or not to work for additional hours was coded as “yes” or “no”. The response for additional hours available could be for another job (jobs) in addition to the current job; replacing any of current jobs by another job with increased hours of work or longer time on the current job.

The distribution of employed population whether they were available or ready to work additional hours for urban areas of the country by age group and sex is shown in Table 5.27. Table 5.28 shows distribution of employed persons who sought or available to work additional hours together with the actual number of hours worked by age group and sex for the total urban areas of the country. Table 5.29 presents the distribution of urban employed population of each region who were sought or available to work additional hours classified by type of work sought or available for and sex.

5.9 Formal and Informal Employment Sectors of the Economic Activity

For statistical purposes, the informal sector is regarded as a group of production units, which according to the definitions and classification provided in the United Nation System of National Accounts (SNA Rev.4), form part of the household sector as household enterprises or, equivalently, unincorporated enterprises owned by households. The informal sector is defined irrespective of the kind of work place where the productive activities are carried out, the extent of fixed capital used, the duration of the enterprise and its operation as main or secondary activity of the owner.

The figures here were not referring to the whole employed population. In this survey, according to the 15th ICLS recommendations, those employed persons who were engaged in subsistence

farming and work in private households were exempted from the analysis of the formal and informal sectors of the economic activity.

This survey includes questions to identify the employment sector of the economy and some of the characteristics in which the employed persons are engaged in their main activity. However, employed persons whose employment status were classified as employee-government, employee-government parasitatal, employee-non-governmental organization, or members of producers' cooperative were not necessary to ask such questions related to the activities of their sectors because they were considered as formal and later classified as being working in the formal sector. On the other hand, other employed persons whose status in employment were employer, employee of private organization, self-employed, and apprentice were asked the following questions whether the business /enterprise they were engaged in,

- a) Does the enterprise have book of account; or
- b) Does the enterprise have a license; or
- c) Does the product/Service of the organization you engaged in is mainly for market?

Based on the response to these three questions, classification on sector of economy was made as: formal, informal or “not identified”. Employed persons who satisfy at least one of the above conditions (‘a’ or ‘b’ answered ‘yes’) were considered as working in the formal sector. On the contrary, those who respond “no” for ‘a’ and ‘b’ and ‘yes’ for ‘c’, the activity was taken as informal. For those who don't know the situation about their main activity/business/ enterprise with respect to the above questions was labeled as “not identified”.

Table 5.30 presents the distribution of employed population of urban areas of the country in relation to the sector of the economy classified by age group and sex. The distribution of employed population by sector of economy, region and sex is presented in 5.31. Similar information for selected major town is shown in Table 5.32. Table 5.33-5.36 presents the cross classification of the informal sector by sex and region by some of the selected variables, such as major occupation and branches of economic sector, educational attainment and working place. The last Table 5.37 has shown the distribution of total employed population by Mean number of hours worked with major branches of economic sector in each region and sex.

Relating to the distribution of formal and informal employment, which excludes subsistence farming and those working in private households 1,266,604 persons were engaged in the informal sector out of the total 6,317,407 urban employed persons make up 20% of the total employment in urban areas. Among, the total employed persons in informal sector of economy 686,182 (27.3%) were females and 580,422 (15.2%) were males.(See Table 5.30) .

5.10 Occupational Injuries/Accident and use of Protective Wears

An occupational injury is defined as any personal injury, disease or death resulting from an occupational accident; an occupational injury is therefore distinct from an occupational disease, which is a disease contracted as a result of an exposure over a period of time to risk factors arising from work activity. An occupational accident is an unexpected and unplanned occurrence, including acts of violence, arising out of or in connection with work which results in one or more workers incurring a personal injury, disease or death.

Personal protective equipment (PPE) is equipment that will protect the user against the risk of accidents or of adverse effects on health. It can include items such as safety helmets, gloves, eye protection, high-visibility clothing, safety footwear, safety harnesses and respiratory protective equipment (RPE). (ILO, 1981 C No.155)

Table 5.38 to Table 5.40 shows the distribution of employed persons of the country and regions by Digital Literacy, Status of Protective use and types of Protective Wears used and Status of Occupational Injuries disaggregated by Place of residence and sex.

CHAPTER VI

5. UNEMPLOYMENT IN URBAN AREAS

6.1. Introduction

Unemployment is one of the indicators that have been used to measure the extent of unutilized human resource in the economy at a given area or region in a certain period of time. It indicates the quantity and quality of the human labour a nation or a region would have, and should be used to promote its economic development, but not actually used. The unutilized human resource as a result of unemployment has its own social and economic implication. Therefore, the availability of reliable and timely statistical data on unemployment is vital to formulate and design new strategies as well as to monitor the existing employment policies.

A wide range of information regarding unemployment and the characteristics of unemployed population were collected in June 01/2022 – July 05 /2022. This information is useful to estimate the number of unemployed population and rate of unemployment at various reporting levels.

This chapter presents the size of unemployed population and rate of unemployment at national, regional and major urban levels. In addition, the characteristics of unemployed population such as age, sex, education, training status, marital status, previous work experience, duration of unemployment, types of jobs looking for, problems in establishing own business, or found paid employment, causes and consequences of unemployment and means of livelihood ... etc., are presented in detail. This information was collected from persons aged ten years and above by using the two known common measurement approaches, namely current and usual status approaches. But, the result presented in this chapter refers to only the current activity status approach.

During the data collection period, respondents in the sampled household were asked detailed labour force questions using structured questionnaires. These includes:-

- a. Whether they were seeking for employment, if not reason for not seeking.
- b. Whether available for work during the coming one month, if not reason for not being available.
- c. Types of job looking for i.e. self-employment or paid employment or others

- d. Types of problems the unemployed faced to establish own business.
- e. Previous work experience and duration of unemployment.
- f. Causes and consequences of unemployment.
- g. Means of livelihood for the unemployed and the Inactive population

Based on the responses obtained from the respondents aged ten years and above, the measurement of unemployment was done using various methods.

6.2. Measurement of Unemployment

The measurement of unemployment is refers to the following three criteria that must be satisfied simultaneously: “without work”, “currently available for work” ‘and “seeking work”’ (ILO, 1983). The standard definition of unemployment is based on the "seeking work" criterion that can be interpreted as activities or efforts that non-working persons performed to look for jobs during a specified reference period or prior to it (i.e., paid or self-employment). The specific steps include registration at a public or private exchange; applying to employers; checking at worksites, farms, factory gates, market or other assembly places; placing or answering newspaper advertisements; seeking assistance of friends or relatives; visit vacancy boards; job search through website, looking for land, building, machinery or equipment to establish own enterprise, and arranging financial resources; applying for work permits and licenses...etc.

However, the standard definition of unemployment with its emphasis on seeking work criterion might be restrictive and might not fully capture the prevailing employment situations in many developing countries including Ethiopia, where the labour market is largely unorganized or of limited scope, where labour absorption is inadequate or where the labour force is largely self-employed.

Hence, the International standards introduced provisions, which allows for the relaxation of the seeking work criterion in certain situations. The provisions are two types, namely, partial relaxation and complete relaxation. Following the recommendations of the International standard and considering the prevailing national situations, the employment and unemployment and related labour force surveys used the above provisions to measure the

different forms of unemployment. The definition of the two provisions is described as follows.

Under partial relaxation, the definition of unemployment includes discouraged job seekers, future start and layoffs in addition to persons satisfying the standard definition. Discouraged job seekers are persons who want a job but did not take any active step to search for work because they believe that they cannot find one. Future starts are those persons without work who have made arrangements to take up paid employment or to undertake self-employment activity at a date subsequent to the reference period. Layoff is a person whose contract of employment or activity has been suspended by the employer for a specified or unspecified period at the end of which the person concerned has a recognized right or recognized expectation to cover employment with the employer (ILO, 1990).

The completely relaxed definition of unemployment includes persons without work and those who are available for work, including those who were or were not seeking work. That is, the seeking work criterion is completely relaxed and unemployment is based on the “without work” and “availability” criterion only. The availability in this situation is tested by asking the willingness to take up work for wage or salary in locally prevailing terms, or readiness to undertake self-employment activity; given the necessary resources and facilities. It should be noted that fulltime students are considered as available if and only if they are ready to withdraw from their studies in order to accept a job.

This survey collected unemployment data in the standard, partially relaxed and completely relaxed options of measurements. After thorough evaluation and assessment of the results obtained using the three alternative and complementary measures; the rates obtained using the completely relaxed definition was found most plausible and hence selected for reporting. In this survey, those persons aged ten years and above who had no work or did not work at least one hour or did not have job to return to, were asked to respond whether they were available or willing to work if job was found during the coming one month. Those who responded “Yes” answer to this question were further tested whether they were ready to take a job under prevailing conditions. By doing so, those persons who had no job but available to work are considered as unemployed at the time of the survey.

6.3. Size and Rate of Urban Unemployment

The proportion of unemployed population aged ten years and above is described using unemployment rate. Unemployment rate is computed as percentage of the unemployed population over the total number of economically active population. The rate indicates that the number of persons who are ready to participate or engaged in the production of goods and services. A higher rate of unemployment implies the loss of individual contributions to the growth of Gross Domestic Product (GDP) as well as the national economy, and hence a waste of human resource.

In Table 6.1 presents the total figure for unemployed population aged ten years and above and total unemployment rate of urban areas of the country and each region by Sex. As per the current status approach, the survey result reveals that the total number of unemployed population was 1,920,314 with 18.9 percent of the unemployment rate at national urban level. The corresponding figures for males and females were (557,083 persons, 10.2 percent), and (1,363,231 persons, 29.0 percent), respectively.

The absolute figure for the unemployed population together with the unemployment rate by each region is also presented in Table 6.1. The highest prevalence rate of unemployment appeared in Addis Ababa City Administration 23.0 percent, followed by Amhara 19.9 percent, and reported above the national average. The lowest unemployment rate reported in Benishangul-Gumuz Region 13.6 percent. The rest of urban areas of other regions fall between 14 – 19 percent of unemployment rate in June 2022.

As regards in absolute figure, the three big region leads the largest share of unemployed population such as Oromiya Region, Amhara and Addis Ababa City Administration contributed more than four hundred fifty thousand, in that order. The lowest share was in Gambella Region. This was go along with their population size adversely affect the number labour force and the unemployment as well (see table 6.1).

Table 6.2.deals with youth unemployed population and youth unemployment rate (age 15-29 years) in urban areas of regions by sex in which the rate of unemployment for youth 27.2

percent covers 1,132,316 youth unemployed population, which was higher than that of the total, adult and older age categories.

Table 6.3 has shown the total unemployed population and unemployment rate classified by age group and region. The unemployment rate by age group is relatively higher for the young age group 15-29 years at national level, this true almost in all the regions. The rate of female unemployment was higher than their counter part in all age groups and regions.

Table 6.4 shows the distribution of unemployed population and unemployment rate for twenty nine selected major towns including region capitals by sex and similar Table 6.5 disaggregated by age group. The total unemployment rate for total major town was 22.3rcent. Among the major towns, the highest unemployment rate reported for Kombolcha town 34.4 percent followed by Burayu town 28.7 percent. The lowest unemployment rate as compared to the highest one was found in Debrebrihan and Dila Logia Sodo Towns 15 percent, 16.1 and 16.8 percent, in that order.

With regard to literacy status of the unemployed population and unemployment rate by sex and for each region are shown in Table 6.6, while the distribution of educational attainment of the unemployed by age group and each region illustrated in Table 6.7 and Table 6.8.

As shown in Table 6.6, the unemployment rate for literate persons is slightly higher than that of the illiterate persons (i.e. 19% against 18.5%). This is true for the two sexes though male outnumber females in the literate categories. In Table 6.7 has been shown the educational attainment which refers to the highest grade completed for those who have been literate. The same Table for each region by educational attainment was also observed in Table 6.8.

As shown in Table 6.7, the overall percentage of unemployment was highest among those with primary education 35.5% followed by secondary completed education 14.6%, the share for never attending about 15%, and the lowest for those with informal and preschool together reported only 0.6%. The share for female unemployment rate was particularity higher than that of males in grade 1-8 (37.5% against 30.4%) and never attending categories (16.7% against 10.5%).

The Unemployed persons age ten years and above by training status and types of training and Sex in urban areas has shown in Table 6.9. The percentage share of non-trained unemployed persons is much higher than trained unemployed (75.4 % against 24.6%). The highest share for female was more pronounced in the not trained category.

The marital status of unemployed persons disaggregated by age group and sex is presented in Table 6.10, and Table 6.11 shows similar information for each region classified only by sex. The majority of male unemployed persons were found in the never married group 62.3%, while females were more dominant in the married category about 66.7%.

Unemployed persons aged ten years and above who were sought for work during the last three months prior to date of interview were asked to report what steps they have taken to seek work and type of work they were looking for during this period was appeared in Table 6.12.

The types of job looked for during the last three months were asked with multiple types of questions, at both national and regional level. The data depicts that the majority of unemployed persons were looking for jobs through the assistance of friends or relatives 29.7%, and searching through vacancy announcement 24.3% out of the contrast category of 100 % for each.

The size of unemployed persons of urban areas of the country categorized by age group, sex, previous work experience and duration of unemployment is presented in Table 6.13. The corresponding figure for each region by sex is presented in Table 6.14. As shown in Table 6.13, out of the total unemployed persons in the country, 57.0 percent had no work experience while the remaining 43 percent have previous work experience prior to the survey date. The majority of females did not have previous work experience 57.7% against those with work experience 42.3%, whereas more males found in the category of prior work experience were 55.4% against 44.6% as compared with those without work experience.

In the same Table 6.13, regarding the duration of unemployment, about 25.6 percent of the unemployed persons have been jobless for less than one year, while long term unemployed, which is being unemployed for one year or more accounted for 74.4 percent.

The survey collected data on the types of job the unemployed were looking for, the majority of unemployed about 58.8% were available to take up any kind of job followed by persons who were intended to establish own business about 26 percent), while those who were looking for paid job in government institution accounted to be about 10 percent followed by 5 percent in private sector and the remaining others covers only 0.1 percent. More females than males found in the category of establishing own business, while more males than females preferred to be available for any kind of job and paid employment categories (see Table 6.15)

From the perspective of seeking for self-employment, the great majority of the unemployed who would like to establish their own business faced financial constraints by 63.5 percent. The next important reason is lack of finance in combination with working place were about 27.9 percent and training 0.7 percent. In a nutshell, those reported different kinds of problems covers 3.5 percent out of the total unemployed who wants to establish their own business, while those who do not have any problem were only about 4.4 percent (see Table 6.16).

Besides, the unemployed persons who were interested for paid job were asked about reasons for not finding paid job and the problem they faced. More than half of the unemployed (64.7percent) reported that they could not find paid employment due to lack of job opportunity and skill mismatch. Personal reasons like lack of experience and training were together accounted for 19.1 percent, and the rest 16.1 percent were in the cases of labour market related reasons (Table 6.17).

In Table 6.18 depicts the types of problems they faced due to being jobless, here decline of household or personal income and unable to cover household expenses including school fee reported about 77.5 percent. Psycho-social problems like getting stress, hopelessness, being isolated, exposed to addiction and family dissolution reasons together reported about 16.2 percent, followed by fed up looking for jobs 4.2 percent, and the reaming percentages take up by other reasons 1.1 percent.

Questions related to means of lives or the types of support were also administered for both the unemployed and inactive population and shows in Table 6.19. According to the survey result, the majority of couples (43.4 percent) to be supported by their own spouses/ husband or wife/, and family and other relatives support (45.1 percent). Engaging in casual work and saving were about 6.6 percent and through remittance 1.4 percent and using safety net together with other means were reported only 3.5 percent (For detailed information see also Statistical Report, June 2022).

ANNEXES

Annex I

1. Survey Questionnaire

URBAN EMPLOYMENT UNEMPLOYMENT SURVEY: 2022

- 1.1. SECTION 1. AREA IDENTIFICATION OF THE SELECTED HOUSEHOLD**
- 1.2. Section 2 Cont'd: Disability Status**
- 1.3. SECTION 3: ECONOMIC ACTIVITY DURING THE LAST 7 DAYS (For members age 5 years and above)**
- 1.4. SECTION 3: THE LAST 7 DAYS /Cont'd/**
- 1.5. SECTION 3: THE LAST 7 DAYS /Cont'd/**
- 1.6. SECTION 4: CHARACTERISTICS OF UNEMPLOYED PERSONS (For those aged 10 years and above)**
- 1.7. SECTION 5: ECONOMIC ACTIVITY DURING THE LAST 12 MONTHS (For members age 5 years and above)**

Annex II

2. Estimation Procedures of Total, Ratio and Sampling Errors

2.1. The following formulas were used to estimate the required variables by reporting levels.

1. Estimate of Total \hat{Y}_h

Since we utilized two stage-clusters sample design to select households from each of the stratum under major urban and other urban domains (Category I and Category II), the estimation follows same procedures.

$$\hat{Y}_h = \sum_{i=1}^{n_h} \sum_{j=1}^{h_{hi}} W_{hi} Y_{hij}$$

Where,

$W_{hi} = \frac{M_h H_{hi}}{n_h M_{hi} h_{hi}}$ is the basic sampling weight?

The following notations were used in the formula

M_h = Total number of households in stratum h obtained from the sampling frame.

M_{hi} = Total number of households in EA/PSU_i for major urban domain/ other urban domain, in stratum h obtained from the sampling frame.

H_{hi} = Total number of households obtained from the survey listing in sample EA/PSU_i and stratum h for major urban/ other urban domain.

h_{hi} = Total number of households successfully covered in EA/PSU_i and stratum h for major urban/ other urban domain.

n_h = Number of successfully covered EAs for major urban domain/ other urban domain in stratum h.

\hat{Y}_{hij} = The observed value of characteristic y for household j in EA/PSU_i, stratum h of major urban/ other urban domain.

Note: Estimate of total at country level, \hat{Y} , is obtained by summing up stratum/domain total estimates.

$$\hat{Y} = \sum_h \hat{Y}_h$$

2. Sampling Variance of the Estimates:

Sampling variance of estimate of stratum total is given by the following formulas:

The variance of domain or reporting total estimates is:

$$Var(\hat{Y}_h) = (1 - f_h) \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right)^2 + f_h \sum_{i=1}^{n_h} (1 - f_{hi}) \left(\frac{h_{hi}}{h_{hi} - 1} \right) \sum_{j=1}^{h_{hi}} \left(\hat{Y}_{hij} - \frac{\hat{Y}_{hi}}{h_{hi}} \right)^2$$

In which $\hat{Y}_{hi} = W_{hi} \sum_{j=1}^{h_{ij}} Y_{hij}$ for major urban domains and $\hat{Y}_{hi} = W_{hi} \sum_{j=1}^{h_{ij}} Y_{hik}$ for other urban center domain,

$$V(\hat{Y}) = \sum_h V(\hat{Y}_h)$$

$$SE (\hat{Y}_h) = \sqrt{Var (\hat{Y}_h)}$$

3. Coefficient of Variation (CV) and Confidence Interval (CI)

The following formulas were used to calculate CV and CI of the domain (reporting level) total.

The coefficient of variation (CV) of domain total in percentage is:

$$CV(\hat{Y}_h) = \frac{\sqrt{VAR (\hat{Y}_h)}}{\hat{Y}_h} * 100$$

and Ninety-five percent confidence interval (CI) of domain total:

$$\hat{Y}_h \pm 1.96 * SE(\hat{Y}_h)$$

4. Ratio Estimates:

$$\hat{R}_h = \frac{\hat{Y}_h}{\hat{X}_h} \text{ and } \hat{R} = \frac{\hat{Y}}{\hat{X}}$$

Where the numerator and the denominator are estimates of domain totals of characteristic, y and x, respectively.

$$Var (\hat{R}_h) = \frac{1}{\hat{X}_h^2} [Var(\hat{Y}_h) + \hat{R}_h^2 Var (\hat{X}_h) - 2\hat{R}_h Cov (\hat{Y}_h, \hat{X}_h)]$$

In which

$$\begin{aligned} Cov (\hat{Y}_h, \hat{X}_h) = & (1 - f_h) \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right) \left(\hat{X}_{hi} - \frac{\hat{X}_h}{n_h} \right) \\ & + f_h \sum_{i=1}^{n_h} (1 - f_{hi}) \left(\frac{h_{hi}}{h_{hi} - 1} \right) \sum_{j=1}^{h_{hi}} \left(\hat{Y}_{hij} - \frac{\hat{Y}_{hi}}{h_{hi}} \right) \left(\hat{X}_{hij} - \frac{\hat{X}_{hi}}{h_{hi}} \right) \end{aligned}$$

for major urban/ other urban domain.
